Description

W1PARKS contains public parks data for Wave I respondents based on the parks component of StreetMap Pro (v. 5.2, July 2003) from Environmental Systems Research Institute in Redlands, CA. The parks component of the StreetMap Pro dataset contains boundaries for parks, forests, and recreation areas at the national, state, and local levels. The variables collected can be summarized as follows.

- Counts of local parks within a Euclidean (i.e., "straight-line") distance of 1, 3, 5, and 8.05 kilometers (5 miles) of each respondent.
- Counts of local parks within a Euclidean distance of 3, 5, and 8.05 kilometers of each respondent weighted by the Euclidean distance in kilometers.
- Summary statistics for Euclidean distances (in meters) to and areas (in square meters) of local parks within 1, 3, 5, and 8.05 kilometers of each respondent.
- Euclidean distance to the major park that is nearest to each respondent, with no maximum distance cutoff.

Weighted counts were calculated in the following manner.

- If the local park Euclidean distance was less than or equal to one kilometer, the count weight equaled one.
- If the local park Euclidean distance was greater than one kilometer, the count weight equaled one divided by the Euclidean distance in kilometers (with two decimal places).

For example, a local park 743 meters from a respondent would have a count weight of one. A local park 3,743 meters from a respondent would have a count weight of one divided by 3.74 (which equals 0.27). Since the count weight for local parks less than or equal to one kilometer was always one, there were no separate weighted count variables generated for the one kilometer distance.

If there were no local parks within a respondent's five-mile buffer, the counts and weighted counts were set to zero, and values for the remaining variables were set to the Add Health legitimate skip code. The code assigned was based on the maximum values for the various statistics that were calculated (i.e., maximum, minimum, median, mean, Q1, Q3, standard deviation, and skewness). Add Health's replacement code pattern for legitimate skip is 7 preceded by a series of 9s, with the number of 9s dependent upon the variable's maximum value. For specificity, regard the following list.

Area statistics, maximum, minimum, median, mean, Q1, Q3, and standard deviation, measured in square meters: legitimate skip code equals 999997.

Skewness for area measures: legitimate skip code equals 97 (maximum possible value of non-skip equals 7.30).

Euclidean distance statistics, maximum, minimum, median, mean, Q1, and Q3, measured in meters: legitimate skip code equals 9997.

Euclidean distance statistic, standard deviation, measured in meters: legitimate skip code equals 997 (1km buffer, maximum possible value of non-skip equals 700.70 meters) or 9997 (3km, 5km, and 8km).

Skewness for Euclidean distance: legitimate skip code equals 7 (maximum possible value of non-skip equals 2.22).
