Add Health Wave I Resources and Distance Measures

Filename: w1rcdist.xpt

Description

This Add Health data file measures the presence of various physical activity (PA) resources situated near respondent residences. Specifically, the file contains counts, counts weighted by distance, and univariate distance statistics of these resources based on Dun & Bradstreet (D&B), 1995, within 1, 3, 5, and 8.05 km (5 miles) of Wave I respondent locations.

All calculations were performed in accordance to PA categories, which were based on D&B primary Standard Industrial Classification (SIC) code and keyword searches within the company name and trade style fields. The activity categories and corresponding criteria, which are summarized in Table 1, are detailed in Appendix A. Note: Some overlap among the PA categories exists.

Table 1: PA Resource Categories

General Description
All: Combination of all other PA categories except Inactivity (see below).
Inactivity: Movie theaters and arcades.
Instructional: Facilities with “instruction” or “school” or “professional” or “class” in SIC code title, but only for PA-related things, not schools in general.
Membership: Facilities with “membership” and “club” in SIC code title.
Outdoor: Facilities and camps that are “outdoor” in character. Those that are not necessarily “outdoor” are not included.
Public Fee: Facilities that are open to the public (non-member), but that charge a fee and would not be categorized as Instructional, Schools, Membership, etc.
Parks (with commercial operations).
Public: Public beaches, pools, tennis courts, parks, community centers, recreation centers.
Schools: Only academic schools or colleges, not schools set up to provide PA opportunities, which are included under Instructional.
YMCA: YMCAs were extracted from the D&B source data based on keyword search rather than SIC code match, as YMCAs were not reported under a consistent SIC code.
Youth Organization: Includes youth camps plus YMCAs, boy and girl scout organizations, etc.

Distances to PA resources, and the derived count weights and univariate statistics, were calculated as both Euclidean (“straight-line”) and network (along the street network) measures. The search radii that determined the neighborhoods within which these distance-based calculations—and the unweighted counts—were performed were also defined as both Euclidean and network. As a result, there were three possible combinations of data and neighborhood type as follows:

Euclidean within Euclidean (see Figure 1);
Network within Euclidean (see Figure 2); and
Network within network (see Figure 3).

With respect to weighted counts, the weights were based on either Euclidean or network distance in following manner.

If resource distance was less than or equal to one kilometer, the count weight equaled one.

If resource distance was greater than one kilometer, the count weight equaled one divided by the distance in kilometers (with two decimal places).

For example, a resource 743 meters from a respondent would have a count weight of one. A resource 3,743 meters from a respondent would have a count weight of one divided by 3.74 (which equals 0.27). Since the count weight for resources less than or equal to one kilometer always equaled one, there were no separate weighted count variables generated for the one kilometer distance.

If the resource count within a particular search radius was zero, the corresponding weighted count was also set to zero, and the derived distance statistics were set to the replacement code for legitimate skip. The Add Health replacement code pattern for legitimate skip is 7 preceded by a series of 9s, with the number of 9s dependent upon the variable's maximum value.

For more detail concerning the possible combinations of data and neighborhood type, see Table 2 on the following page.
